# Status Transitions

B2B Quote Documentation · </b2b-quote/admin/status-transitions>

Status transitions define which status changes are allowed (and can be validated/enforced by workflow rules).

## Why It Matters

- Prevent invalid jumps (e.g., `draft` → `ordered`)
- Enforce internal process rules (review before approval)
- Keep automation predictable

Note: Frontend and admin UI always validate transitions. Workflow rule actions can optionally bypass/validate depending on `b2bquote/workflow/transition_validation`.

## Where to Configure

In the Magento admin under the B2B Quote section:

- Status transitions grid
- Per-transition rules (allowed source/target)
