Create category prices

Category Price has separate records for customers and customer groups.

Customer category price

Open **Price System > Categoryprice > All Customer Categoryprices** and add a record. Select the customer and category, then enter the quantity, value, price application, website and optional dates.

Customer-group category price

Open **Price System > Categoryprice > All Customer Group Categoryprices**. Select the customer group instead of a customer, then complete the same price fields.

The records are also available from relevant customer, customer-group and category edit screens.

Price fields

Field	Purpose
Qty	Minimum quantity for the category price
Value	Fixed price, surcharge or discount value
Price application	Fixed, Surcharge, Surcharge %, Discount or Discount %
Base Price	Source used by a relative application type
Website	Global or website-specific scope
From Date / To Date	Optional active period

Products become eligible through Magento category membership. A product assigned to several categories can therefore match several records; see [conflict handling](#) for how the matching record is chosen, and test such products before rollout.

Test the exact quantity threshold and one unit below it. Also test an account that has both a customer and group record so the configured conflict rule is proven.
