## Add-Ons

The base Custom Catalog package covers named catalogs, audience assignments and storefront access control. Install an add-on only when the project needs an additional integration or storefront implementation.

| Add-on             | Install it when you need                                                                       | Composer package                         |
|--------------------|------------------------------------------------------------------------------------------------|------------------------------------------|
| REST API           | Magento REST endpoints for named catalogs and product, customer and customer-group assignments | <code>mageb2b/custom-catalog-api</code>  |
| Hyvä Compatibility | Custom Catalog storefront components on a Hyvä-based store                                     | <code>mageb2b/custom-catalog-hyva</code> |

Each add-on requires the base `mageb2b/custom-catalog` package. See the individual guide for exact commands, permissions and verification steps.
