Magento 2 Extension Custom Catalog

Custom Catalog

Custom Catalog controls which products a signed-in customer can see and buy. Products can come from named catalogs assigned to customers or customer groups, plus direct product grants for individual customers.

Choose an access mode

- **Override hidden if assigned** lets an assignment make an otherwise hidden product available. Products that are normally visible remain available.
- **Strict whitelist (assigned only)** limits the customer to products allowed through active assigned catalogs or direct grants.

The first mode adds exceptions to the normal catalog. Strict mode creates a private assortment.

How assignments combine

A customer's allowed set can include products from directly assigned catalogs, catalogs assigned to the customer's group, and direct customer-product grants. Catalog audience assignments are store-view scoped, and inactive catalogs do not contribute products.

The customer account includes a **My Products** page. It can show all allowed products, catalog products only, or direct grants only.

Start here

1. Install the extension.
2. Choose the access and My Products modes.
3. Create a catalog, add products and assign an audience.
4. Test category pages, search, direct product URLs, cart behavior and My Products.

For subaccount-specific assortments, see Sublogin Custom Catalog.

The optional REST API manages named catalogs and their assignments, and the Hyvä compatibility package provides the storefront integration for Hyvä themes — see the add-on overview.

See Common Issues, Caching and Indexing and the FAQ when an assortment does not behave as expected.
