Price Selection

Customer Specific Prices · /customerprice/price-selection

Customerprice is a Pricsystem price type. Pricsystem calculates multiple candidate price types and then selects the final purchasable price using a configurable strategy.

This section documents the global selection logic, because it affects how `customer_price` competes with other price types (special price, tier price, pricelist, etc.).

Customerprice In The Strategy

- Price code: `customer_price`
- This price type is only available if the Customerprice module is installed and a matching customer price exists for the current context.

Tip: if you want customer-specific prices to win, put `customer_price` near the top of your sort order list.
