# Factur-X

Factur-X is a hybrid CII document: a readable PDF carries embedded structured XML. The module uses the same profile selector and hybrid-PDF builder family as ZUGFeRD, with Factur-X 1.09 identifiers and schemas.

## Output

| Property | Supported behavior |
| --- | --- |
| Format version | Factur-X 1.09 |
| Syntax | UN/CEFACT Cross Industry Invoice (CII) |
| Document type | Hybrid PDF with embedded XML |
| Profiles | MINIMUM, BASIC WL, BASIC, EN 16931, EXTENDED |
| Invoice and credit memo | Formatters are included for both |

Configure the SIRET number when it is relevant to the seller and verify VAT, registration, address and payment information with the intended receiver.

## Activation

The invoice formatter reads **Default B2B Format** at store scope. Select Factur-X there, save the same store view and confirm **Enable E-Invoicing** is enabled. No hidden enabled-formats setting is required.

## Configure and test

The intended setup is:

1. set **Default B2B Format** to **Factur-X 1.09**;
2. select the recipient's profile in **ZUGFeRD / Factur-X Configuration**;
3. complete SIRET and other seller fields that apply;
4. generate invoice and credit-memo samples;
5. validate both the XML and hybrid PDF with the recipient.

## Files and delivery

Permanent storage writes separate XML and hybrid PDF files. The automatic email strategy prefers the PDF. The module creates files but does not send them to a French public platform or clearance provider.
