EXTENSION
Magento 2 Extension E-Invoice

XRechnung

SoftwareSilo E-Invoice generates XRechnung as CII XML. Store views can select version 2.2, 2.3 or 3.0. The formatter is deliberately XML-only; it does not create a hybrid PDF or upload the document to a portal.

Configure the format

1. Set **Default B2B Format** to **XRechnung 3.0.x (B2B)**.
2. Select the exact version required by the receiver.
3. Complete seller contact name, phone and email.
4. Confirm how the buyer reference or Leitweg-ID reaches the generated XML in your project.
5. For public-sector recipients, choose the format under **B2G Format (Public Sector)** and configure B2G detection so those orders are typed `b2g` and fail clearly when no Leitweg-ID can be resolved.
6. Enable the appropriate validation level and generate a manual sample.

The module's internal validator checks structure and its bundled XSD. It does not enforce a Leitweg-ID because the formatter also supports B2B usage — strict BT-10 enforcement applies only to orders detected as B2G. A public-sector receiver may apply additional rules and reject a structurally valid file without its required routing reference.

Output and credit memos

XRechnung produces XML only for invoices and credit memos. Credit memos additionally use document type `381` or `384` from the credit-memo configuration.

If users need a readable invoice, keep Magento's ordinary PDF in the workflow. Selecting **PDF only** as the e-invoice attachment strategy produces no XRechnung PDF.

Submission is separate

The module does not upload to ZRE, OZG-RE or another receiving portal. Submission, credentials, transport acknowledgements and portal-specific validation belong to the connected delivery process.

Validate a real sample

Check seller contact, buyer reference, purchase-order reference, payment instructions, VAT categories, totals and the selected version. Then validate with the receiver's current rule set. Do this before changing the generation mode from manual to automatic.
