Database Reference

Flex Shipping keeps the customer-facing method, its rates and its eligibility rules separate. This lets one shipping method support several rate tiers and rule conditions.

Relationship	Why it matters
<code>flex_shipping_method</code> belongs to one <code>store_website</code>	Limits the shipping method to the website where it is configured.
<code>flex_shipping_rate</code> belongs to one <code>flex_shipping_method</code>	Stores the prices or tiers evaluated for that method.
<code>flex_shipping_rule</code> belongs to one <code>flex_shipping_method</code>	Controls when the method is available for a cart or customer.
<code>flex_shipping_audit</code> belongs to one <code>store_website</code>	Keeps evaluation and change history within the correct website scope.

This overview does not document rule payloads or internal audit columns. Configure methods through Magento Admin.
