Run the Queue Consumer

Queued adjustments are processed by:

```
mageb2b.pricesystem.price_adjustment.consumer
```

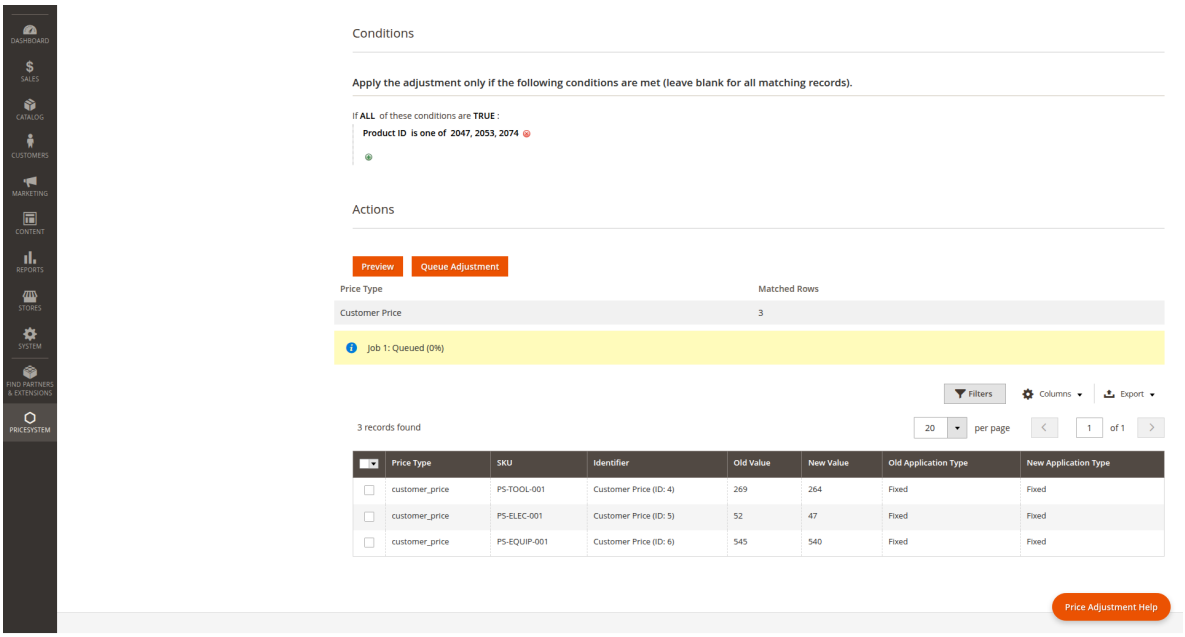

Run it directly for a controlled one-job check:

```
php bin/magento queue:consumers:start \
  mageb2b.pricesystem.price_adjustment.consumer \
  --max-messages=1
```

For normal operation, add the consumer to the queue worker or process supervisor used by the shop. Do not rely on an administrator keeping a terminal open.

Job states

- **Queued**: published and waiting for the consumer.
- **Processing**: the consumer has started the job.
- **Completed**: the selected records were processed.
- **Failed**: the job stopped and its error must be reviewed.

After completion, clean or warm the Price System cache according to the size of the change and verify a representative customer/SKU calculation.
