Price Selection

Price System first collects every price that is valid for the current product, customer, quantity, website and date. It then uses one selection strategy to choose the final value.

There are two different kinds of priority:

1. A price product resolves its own competing records. A Product-Customer Matrix, for example, can use matrix priority when two matrices match.
2. Price System compares the resulting price types. This is where Lowest, Highest, Sort order or Formula applies.

Keeping those steps separate makes most pricing questions easier to diagnose.

Choose a strategy

- Global system configuration
- Sort order
- Customer-group overrides
- Customer overrides
- Formula pricing

Customer and group overrides, custom sort orders and formulas require Advanced Config.
