Database Reference

Price System coordinates installed price providers. Its own relational data is limited to customer and customer-group sort positions used during price selection.

Relationship	Why it matters
<code>pricesystem_customer_sort_position</code> belongs to one <code>customer_entity</code>	Stores customer-specific ordering used by the configured price-selection strategy.
<code>pricesystem_customer_group_sort_position</code> belongs to one <code>customer_group</code>	Stores the corresponding ordering for customer groups.

Actual prices remain in the installed price-type modules, such as Customer Price, Price List or Category Price. Use their reference pages when planning pricing imports or integrations.
