Product Fees Documentation · /productfee/reference/database

This page provides a high-level overview of how Product Fees data is structured.

Fee Types

A fee type defines reusable metadata such as:

- internal code
- customer-facing label
- calculation type (fixed/percent)
- taxable flag
- active status and sort order

Product Assignments

Fee types are assigned to products with website scope and amount values.

Sales Snapshots

When a customer checks out, fee details are stored as snapshots on sales items so the same fee breakdown can be reused in:

- orders
- invoices
- credit memos
- emails and PDFs

Why Snapshots Matter

Snapshots keep fee values stable for document history, even if fee setup changes later.

Note

This customer-facing KB intentionally avoids SQL instructions. Use admin workflows for setup and maintenance.
