Database Reference

A Shipping Conditions rule stores its scope, audience, targets and actions separately. This lets one rule address several Store Views, customer groups or shipping methods without duplicating the rule itself.

Relationship	Why it matters
<code>shipping_condition_rule_store</code> assigns a rule to one <code>store</code>	Controls the Store Views in which the rule can be evaluated.
<code>shipping_condition_rule_customer_group</code> assigns a rule to one <code>customer_group</code>	Limits the rule to the intended customer audience.
<code>shipping_condition_rule_target</code> belongs to one <code>shipping_condition_rule</code>	Identifies the shipping methods or rates affected by the rule.
<code>shipping_condition_rule_action</code> belongs to one <code>shipping_condition_rule</code>	Defines what changes when the rule matches.

Rule conditions and action payloads are deliberately omitted. Manage them through the rule builder so serialization and validation remain intact.
